

DIAMOND FIELDS
INTERNATIONAL LTD.

**FIRST QUARTER REPORT
THREE MONTHS ENDING SEPTEMBER 30, 2000**

Dear Shareholders:

During the first quarter ended September 30, 2000, Diamond Fields announced the positive results of the Sea Diamonds Project Feasibility Study and its decision to proceed with the project, subject to financing. The receipt of our feasibility study confirms our vision that Diamond Fields is now uniquely positioned to become the world's next producer of gem quality diamonds. The Sea Diamonds Project is located near Luderitz, Namibia.

FEASIBILITY STUDY HIGHLIGHTS

This report was prepared exclusively for Diamond Fields by AGRA Simons Limited, MRDI Canada, a division of AGRA, Seacore Limited, Dowding Reynard and Associates, Sue Lane and Associates, Diamond Tenders Belgium and other industry consultants were also retained to assist in the preparation of this detailed feasibility study.

PROJECT ECONOMICS

The base case for the Sea Diamonds Project consists of mining reserves and resources, over a seven-year mine life. The base case provides an after-tax internal rate of return (IRR) of 54% and a net present value (NPV) at a discount rate of 10% of US\$31.2 million. Payback of capital is estimated to be 16 months from the commencement of mining operations.

Should only the probable reserves be considered, the mine life would be shortened to 5.8 years, and the project would yield an IRR of 46% and a NPV at a discount rate of 10% of US\$22.8 million. The payback period in this case would be 18 months from the commencement of mining operations. Should carats resulting from the suspected sampling bias be added to the base case, the project would yield an IRR of 133% and a NPV of US\$111.6 million.

Capital costs include all expenditures for detailed design and procurement of equipment, vessel chartering and contracting of facilities required to bring the Sea Diamonds Project into operation, and are estimated to total US\$28.1 million (including US\$2.0 million cash in working capital) over a twelve-month development period. Annual cash operating costs, based on mining an annual average of 873,000 m³, are projected to be US\$13.5 million before royalties, marketing and taxes.

MINING

Mining will involve the systematic exploitation of the Marshall Fork feature, followed by the Diaz Reef resources. Ore value, tailings disposal and numerous other geological and mining considerations influence the mining sequences. The mine plan incorporates a time provision for annual sampling in support of detailed mine planning, upgrade and correction of resource estimates (in light of the suspected sampling bias), and potential expansion of the resource base beyond the current estimate level.

MARKETING

There are several potential marketing options available to Diamond Fields including selling through De Beers' Diamond Trading Company (DTC), sales at tender, joint venture or agency agreement with one or more established dealers or direct sales through a company marketing organization. A formal decision on the marketing channel(s) will likely be made shortly before the commencement of production. The diamonds found on the Sea Diamonds Project consist of over 95% gem quality stones, which currently yield an average market price of US\$150-200 per carat.

The recent publicity on conflict diamonds does not affect the Namibian diamond industry or Diamond Fields' planned operations. Diamond Fields does not, has not, and will not deal in conflict diamonds and fully supports the diamond industry's proposals to isolate diamond trade from conflict areas.

Diamond Fields' focus for this fiscal year will be securing project financing and meeting all the requirements of the study to become the world's next producer of gem quality diamonds. We believe that, based on the potential high profitability of the project combined with low capital costs, financing of the project is achievable. Management has been in negotiations with several international financial institutions regarding financing for the Sea Diamonds Project.
